

1. Evidence Acquisition

EXH-11 is a simulated skimmer. EXH-12 is a simulated phone.

Files are separated by exhibit and preserved with stable names.

The chain-of-custody form records transfers and integrity checks.

2. Artefact Analysis

The evidence contains synthetic configuration, log, message and email artefacts.

The search script checks selected terms and writes a simple log.

Recovered records are labelled test data and contain no real customer data.

3. Legal and Ethical Discussion

The scenario can be discussed under relevant IT Act provisions and historical IPC terminology.

A real current case requires checking the law in force at the relevant time.

All tools in this repository are limited to the bundled academic simulation.

Conclusion: acquisition, hashing, search and reporting form one reproducible workflow.
